OBJECTIVE

Computer science undergraduate specializing in AI and Cybersecurity, seeking a Software Developer role to build a strong engineering foundation before transitioning into Cybersecurity (Blue Team). Hands-on experience building full-stack applications, automation tools, and security-focused projects.

EDUCATION

BS-MS in Artificial Intelligence and Cybersecurity (Hybrid)

Centre for Emerging Technologies (CET), IIT Patna

Expected Graduation (BS): 2029

CPI: 8.31/10 (through 3rd Semester) | Semester 1 SPI: 7.78 | Semester 2 SPI: 8.81

TECHNICAL SKILLS

Languages: Python, JavaScript, HTML, CSS, Kotlin (basic), MATLAB (basic)

Frameworks & Libraries: Flask, React

Concepts: Data Structures & Algorithms (Python), Git & Version Control, Web Scraping & Automation

Cybersecurity: TryHackMe (Top 7% Global Rank) - completed all beginner rooms and majority of free rooms, including AI Security

PROJECTS

Python Debugging Learning Game | Python, Flask

- Built an interactive coding-practice application with 22 curated debugging challenges spanning beginner to expert difficulty, based on common real-world programming errors
- Implemented automated answer validation using Python `exec()` and I/O capture to execute and evaluate user-submitted code in real time
- Designed the platform for extensibility, with Arena and Story modes planned as future feature additions

General-Purpose Web Scraping Engine | JavaScript

- Developed a modular, reusable scraping engine that supports new websites through custom extension files built on a predefined function interface
- Originally built for content aggregation on a personal project, then refactored into a general-purpose framework applicable to any target site
- Reduced onboarding effort for new target websites by decoupling site-specific logic from the core engine

Anti-Bot Detection & Security Layer Bypass Tool | JavaScript

- Built a tool to navigate common bot-detection and security layers (e.g., Cloudflare) to support reliable data collection for a personal scraping project
- Worked with HTTP request/response handling, custom headers, and browser fingerprinting techniques
- Evaluated the feasibility of packaging the system as a standalone API service

Cyber Escape Room (In Progress) | Python

- Designing a cybersecurity-themed puzzle and escape-room game to teach security concepts through interactive gameplay
- Evaluating Python and C++ for a planned third-person game format
